Final testing

Team Tested:

- Bit-By-Bit

APIs Tested:

Root API

- **GET** - <https://game-start-api-v1.onrender.com>

Games API

- **GET** - <https://game-start-api-v1.onrender.com/api/games>

AI Recommendation API

- **POST** - <https://game-start-api-v1.onrender.com/com.gamestart/v1/ai/recommendation>

What is good:

- The API works in Postman and returns successful 200OK responses. The root API gives a welcome message the games API returns a large list of game data and the AI recommendation API returns an AI generated response based on the users query. The endpoints are easy to test and the responses are clear.

Issues found:

- The games API returns a very large amount of data, which may be hard to read without filters or pagination. The AI recommendation API works but the endpoint path is long and a little confusing.

Suggestions:

- The team should add clearer documentation for each endpoint, including required method, body format and sample responses. They should also add error cases such as missing query, invalid query, or server error. For the games API, adding search filters like game name, genre, or platform would make it easier to use.

Overall Summary:

- The tested APIs worked successfully in Postman. The strongest part was that each request returned a clear response. The main improvement would be adding clearer error handling and simpler endpoint documentation.
